Mathematics & Number Theory

Binomial Coefficients

CSES ID: 1079

```cpp
/**
 * Author: Team KACTL / Marce
 * Category: mathematics
 * Source: 1079.cpp
 * CSES Task ID: 1079
 * CSES Problem: Binomial Coefficients
 * Link: https://cses.fi/problemset/task/1079
 * Description:
 *   addEventListener("DOMContentLoaded", function (e) {
 *   const mathElements = document.getElementsByClassName("math");
 *   const macros = {};
 *   for (let element of mathElements) {
 *   katex.render(element.textContent, element, {
 *   displayMode: element.classList.contains("math-display"),
 *   throwOnError: false,
 *   globalGroup: true,
 *   macros,
 *   });
 *   }
 *   });
 *   .katex .base:last-child {
 *   display: inline;
 *   }
 *   Time limit: 1.00 s
 *   Memory limit: 512 MB
 *   Your task is to calculate n binomial coefficients modulo 10^9+7.
 *   A binomial coefficient {a \choose b} can be calculated using the formula \frac{a!}{b!(a-b)!}. We assume that a and b are integers and 0 \le b \le a.
 *   Input
 *   The first input line contains an integer n: the number of calculations.
 *   After this, there are n lines, each of which contains two integers a and b.
 *   Output
 *   Print each binomial coefficient modulo 10^9+7.
 *   Constraints
 *   1 \le n \le 10^5
 *   0 \le b \le a \le 10^6
 *   Example
 *   Input:
 *   3
 *   5 3
 *   8 1
 *   9 5
 *   Output:
 *   10
 *   8
 *   126
 */

```

Writing Numbers

CSES ID: 1086

```cpp
/**
 * Author: Team KACTL / Marce
 * Category: mathematics
 * Source: 1086.cpp
 * CSES Task ID: 1086
 * CSES Problem: Writing Numbers
 * Link: https://cses.fi/problemset/task/1086
 * Description:
 *   addEventListener("DOMContentLoaded", function (e) {
 *   const mathElements = document.getElementsByClassName("math");
 *   const macros = {};
 *   for (let element of mathElements) {
 *   katex.render(element.textContent, element, {
 *   displayMode: element.classList.contains("math-display"),
 *   throwOnError: false,
 *   globalGroup: true,
 *   macros,
 *   });
 *   }
 *   });
 *   .katex .base:last-child {
 *   display: inline;
 *   }
 *   Time limit: 1.00 s
 *   Memory limit: 512 MB
 *   You would like to write a list of positive integers 1,2,3,\ldots using your computer. However, you can press each key 0-9 at most n times during the process.
 *   What is the last number you can write?
 *   Input
 *   The only input line contains the value of n.
 *   Output
 *   Print the last number you can write.
 *   Constraints
 *   1 \le n \le 10^{18}
 *   Example
 *   Input:
 *   5
 *   Output:
 *   12
 *   Explanation: You can write the numbers 1,2,\ldots,12. This requires that you press key 1 five times, so you cannot write the number 13.
 */
#include <bits/stdc++.h>

using namespace std;

int main()

 *   });
 *   .katex .base:last-child {
 *   display: inline;
 *   }
 *   Time limit: 1.00 s
 *   Memory limit: 512 MB
 *   Given an integer, your task is to find the number, sum and product of its divisors. As an example, let us consider the number 12:
 *   the number of divisors is 6 (they are 1, 2, 3, 4, 6, 12)
 *   the sum of divisors is 1+2+3+4+6+12=28
 *   the product of divisors is 1 \cdot 2 \cdot 3 \cdot 4 \cdot 6 \cdot 12 = 1728
 *   Since the input number may be large, it is given as a prime factorization.
 *   Input
 *   The first line has an integer n: the number of parts in the prime factorization.
 *   After this, there are n lines that describe the factorization. Each line has two numbers x and k where x is a prime and k is its power.
 *   Output
 *   Print three integers modulo 10^9+7: the number, sum and product of the divisors.
 *   Constraints
 *   1 \le n \le 10^5
 *   2 \le x \le 10^6
 *   each x is a distinct prime
 *   1 \le k \le 10^9
 *   Example
 *   Input:
 *   2
 *   2 2
 *   3 1
 *   Output:
 *   6 28 1728
 */

System of Linear Equations (v2)

CSES ID: 3154

```
/**
 * Author: Team KACTL / Marce
 * Category: mathematics
 * Source: 3154_feito_pelo_gemini.cpp
 * CSES Task ID: 3154
 * CSES Problem: System of Linear Equations (v2)
 * Link: https://cses.fi/problemset/task/3154
 * Description:
 *   addEventListener("DOMContentLoaded", function (e) {
 *   const mathElements = document.getElementsByClassName("math");
 *   const macros = {};
 *   for (let element of mathElements) {
 *   katex.render(element.textContent, element, {
 *   displayMode: element.classList.contains("math-display"),
 *   throwOnError: false,
 *   globalGroup: true,
 *   macros,
 *   });
 *   }
 *   });
 *   .katex .base:last-child {
 *   display: inline;
 *   }
 *   Time limit: 1.00 s
 *   Memory limit: 512 MB
 *   You are given n\cdot(m+1) coefficients a_{i,j} and b_i which form the following n linear equations:
 *   a_{1,1}x_1 + a_{1,2}x_2 + \dots + a_{1,m}x_m = b_1 \pmod {10^9 + 7}
 *   a_{2,1}x_1 + a_{2,2}x_2 + \dots + a_{2,m}x_m = b_2 \pmod {10^9 + 7}
 *   \dots
 *   a_{n,1}x_1 + a_{n,2}x_2 + \dots + a_{n,m}x_m = b_n \pmod {10^9 + 7}
 *   Your task is to find any m integers x_1, x_2, \dots, x_m  that satisfy the given equations.
 *   Input
 *   The first line has two integers n and m: the number of equations and variables.
 *   The next n lines each have m+1 integers a_{i,1}, a_{i,2}, \dots, a_{i,m}, b_i: the coefficients of the i-th equation.
 *   Output
 *   Print m integers x_1, x_2,\dots, x_m: the values of the variables that satisfy the equations. The values must also satisfy 0 \le x_i < 10^9 + 7. You can print any valid solution. If no solution exists print only -1.
 *   Constraints
 *   1 \le n, m \le 500
 *   0 \le a_{i,j}, b_i < 10^9 + 7
 *   Example
 *   Input:
 *   3 3
 *   2 0 1 7
 *   1 2 0 0
 *   1 3 1 2
 *   Output:
 *   2 1000000006 3

 *   Memory limit: 512 MB
 *   A triangle number is a positive integer of the form 1+2+\dots+k. The first triangle numbers are 1, 3, 6, 10 and 15.
 *   Every positive integer can be represented as a sum of triangle numbers. For example, 42=21+21 and 1337=1326+10+1.
 *   Given a positive integer n, determine the smallest number of triangle numbers that sum to n.
 *   Input
 *   The first line has an integer t: the number of tests.
 *   After that, each line has a positive integer n.
 *   Output
 *   For each test, print the smallest number of triangle numbers.
 *   Constraints
 *   1 \le t \le 100
 *   1 \le n \le 10^{12}
 *   Example
 *   Input:
 *   5
 *   1
 *   2
 *   3
 *   42
 *   1337
 *   Output:
 *   1
 *   2
 *   1
 *   2
 *   3

 *   Time limit: 1.00 s
 *   Memory limit: 512 MB
 *   There are n children, and each of them independently gets a random integer number of candies between 1 and k.
 *   What is the expected maximum number of candies a child gets?
 *   Input
 *   The only input line contains two integers n and k.
 *   Output
 *   Print the expected number rounded to six decimal places (rounding half to even).
 *   Constraints
 *   1 \le n \le 100
 *   1 \le k \le 100
 *   Example
 *   Input:
 *   2 3
 *   Output:
 *   2.444444
 */
#include <bits/stdc++.h>
using namespace std;

constexpr int top = 1e2+5;

int main()
{
  int n, k;
  cin >> n >> k;

  long double exp = 0;

  //for (int i = 0; i <= k; i++)
  //  exp += i*( pow((double)i/(double)k, n) - pow((double)(i-1)/(double)k, n));
  // subtração de pow de double da WA. não fazer. ao invez de calcular P(max <= i), abrir isso em
  /*
   * Fórmula original da Esperança:
   * exp += i * (P(max <= i) - P(max <= i-1))
   *
   * MOTIVO DO WA: Subtrair resultados de pow() muito próximos causa
   * "Cancelamento Catastrófico", perdendo as casas decimais de precisão do double.
   *
   * SOLUÇÃO: Soma por partes (Layer-cake representation).
   * Ao invés de multiplicar, abrimos a soma e agrupamos verticalmente:
   * E = 1*P(1) + 2*P(2) + 3*P(3) ...
   *
   * Coluna 0: P(1) + P(2) + P(3) + ... + P(k) = 1.0  (100% de chance de dar <= k)
   * Coluna 1:        P(2) + P(3) + ... + P(k) = 1.0 - P(max <= 1)
   * Coluna 2:               P(3) + ... + P(k) = 1.0 - P(max <= 2)
   * Coluna i:                                 = 1.0 - P(max <= i)
   *
   * Somando todas as colunas, a matemática prova que o resultado é idêntico,
   * mas sem subtrair floats pequenos! O loop vira apenas:
   * Somatório de (1.0 - P(max <= i)) para 'i' indo de 0 até k-1.
  */

  //for (int i = 0; i<k; i++)
  //  exp += 1 - pow((double)i/k, n);

  // o gemini disse que ia resolver
  // nao resolveu. Gemini burro
  // dai o gemini disse que era pra dar um + 1e-9 no cout q ia resolver

  // dai no "gabarito" em https://github.com/Jonathan-Uy/CSES-Solutions/
  // ele faz assim, que é a tecnica inicial, mas com pow manual

Game Theory

Stair Game

CSES ID: 1099

```cpp
/**
 * Author: Team KACTL / Marce
 * Category: game_theory
 * Source: 1099.cpp
 * CSES Task ID: 1099
 * CSES Problem: Stair Game
 * Link: https://cses.fi/problemset/task/1099
 * Description:
 *   addEventListener("DOMContentLoaded", function (e) {
 *   const mathElements = document.getElementsByClassName("math");
 *   const macros = {};
 *   for (let element of mathElements) {
 *   katex.render(element.textContent, element, {
 *   displayMode: element.classList.contains("math-display"),
 *   throwOnError: false,
 *   globalGroup: true,
 *   macros,
 *   });
 *   }
 *   });
 *   .katex .base:last-child {
 *   display: inline;
 *   }
 *   Time limit: 1.00 s
 *   Memory limit: 512 MB
 *   There is a staircase consisting of n stairs, numbered 1,2,\ldots,n. Initially, each stair has some number of balls.
 *   There are two players who move alternately. On each move, a player chooses a stair k where k \neq 1 and it has at least one ball. Then, the player moves any number of balls from stair k to stair k-1. The player who moves last wins the game.
 *   Your task is to find out who wins the game when both players play optimally.
 *   Note that if there are no possible moves at all, the second player wins.
 *   Input
 *   The first input line has an integer t: the number of tests. After this, t test cases are described:
 *   The first line contains an integer n: the number of stairs.
 *   The next line has n integers p_1,p_2,\ldots,p_n: the initial number of balls on each stair.
 *   Output
 *   For each test, print "first" if the first player wins the game and "second" if the second player wins the game.
 *   Constraints
 *   1 \le t \le 2 \cdot 10^5
 *   1 \le n \le 2 \cdot 10^5
 *   0 \le p_i \le 10^9
 *   the sum of all n is at most 2 \cdot 10^5
 *   Example
 *   Input:
 *   3
 *   3
 *   0 2 1
 *   4
 *   1 1 1 1
 *   2
 *   5 3
 *   Output:
 *   first
 *   second
 *   first
 */
#include <bits/stdc++.h>
using namespace std;

Another Game

CSES ID: 2208

```cpp
/**
 * Author: Team KACTL / Marce
 * Category: game_theory
 * Source: 2208.cpp
 * CSES Task ID: 2208
 * CSES Problem: Another Game
 * Link: https://cses.fi/problemset/task/2208
 * Description:
 *   addEventListener("DOMContentLoaded", function (e) {
 *   const mathElements = document.getElementsByClassName("math");
 *   const macros = {};
 *   for (let element of mathElements) {
 *   katex.render(element.textContent, element, {
 *   displayMode: element.classList.contains("math-display"),
 *   throwOnError: false,
 *   globalGroup: true,
 *   macros,
 *   });
 *   }
 *   });
 *   .katex .base:last-child {
 *   display: inline;
 *   }
 *   Time limit: 1.00 s
 *   Memory limit: 512 MB
 *   There are n heaps of coins and two players who move alternately. On each move, a player selects some of the nonempty heaps and removes one coin from each heap. The player who removes the last coin wins the game.
 *   Your task is to find out who wins if both players play optimally.
 *   Input
 *   The first input line contains an integer t: the number of tests. After this, t test cases are described:
 *   The first line contains an integer n: the number of heaps.
 *   The next line has n integers x_1,x_2,\ldots,x_n: the number of coins in each heap.
 *   Output
 *   For each test case, print "first" if the first player wins the game and "second" if the second player wins the game.
 *   Constraints
 *   1 \le t \le 2 \cdot 10^5
 *   1 \le n \le 2 \cdot 10^5
 *   1 \le x_i \le 10^9
 *   the sum of all n is at most 2 \cdot 10^5
 *   Example
 *   Input:
 *   3
 *   3
 *   1 2 3
 *   2
 *   2 2
 *   4
 *   5 5 4 5
 *   Output:
 *   first
 *   second
 *   first
 */
